## FOREWORD

This test report details a fire resistance test conducted on a sheet and stud partition system. The test sponsors was British Gypsum Limited.

The test specimen was installed by British Gypsum Limited. The construction of the specimen took place between the 4<sup>th</sup> and 8<sup>th</sup> September 2000. The Building Test Centre played no role in the design or selection of the materials comprising the test specimen. The boards were delivered direct from British Gypsum's East Leake works.

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedures outlined in EN 1363-1, and where appropriate EN 1363-2. Any significant deviation with respect to size, constructional details, loads, stresses, edge or end conditions other than those allowed under the field of direct application in EN 1364-1 is not covered by this report.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

## REPORT AUTHORISATION

Report Author

**Steve Harms**  
BEng. (Hons)  
Systems Project Leader

Authorised by

**Eur Ing. Paul Howard**  
BSc. (Hons.), CEng., MIOA  
Head of Laboratory

*The Building Test Centre will not discuss the content of this report without written permission from the test sponsor. The Building Test Centre retains ownership of the test report content but authorises the test sponsor to reproduce the report as necessary in its entirety only.*

## TEST CONSTRUCTION

The specimen was constructed in a refractory concrete lined steel restraint frame having an opening of 3000mm high x 3000mm wide.

Gyproc 50C50 channels were fixed to the head and base of the test aperture at 600mm centres with 60mm Hilti Hus fixings. Gyproc 48S50 studs were positioned at 600mm centres between the channels. The right hand stud viewed from unexposed face was not fixed to the perimeter test frame, but the gap between the stud and the lining was filled with a 50mm Rockwool Firebatt gasket. The left-hand stud was fixed to the test frame with 60mm Hilti Hus fixings.

The framework was lined both sides with a double layer 15mm Gyproc wallboard. The inner layer boards were fixed with 25mm Gyproc drywall screws at 300mm centres around the perimeter only. The outer layer boards were fixed with 42mm Gyproc Drywall screws at 300mm centres around the perimeter and at the intermediate stud positions. All vertical joints and horizontal joints were staggered between layers. The horizontal joints were positioned 2400mm from the base on the outer layer and 600mm from the base on the inner layer on both the exposed and unexposed faces of the construction. A Gyproc GFS1 fixing strap is used behind the horizontal board joint in the outer layers.

All external joints were taped and filled using Gyproc Paper Joint Tape and Gyproc Joint Filler as appropriate. All screw heads were spotted using Gyproc Joint Filler.

*The descriptions of individual components making up the test specimen were provided by the customer and were checked for accuracy wherever possible.*

## TEST MATERIALS

### Gyproc wallboard

Nominally, 2400mm (long) x 1200mm (wide) x 15mm (thick), Gyproc wallboard manufactured by British Gypsum Limited.

Measured surface density:	10.6 kg/m <sup>2</sup> .
Measured thickness:	15.5 mm.
Board identification numbers:	2333165 23:40
Moisture content:	<1%

The surface density and board thickness were calculated using a selection of boards used in the test specimen.

### Metal components

- (i) Gyproc 48S50 metal studs and 50C50 channel manufactured from galvanised mild steel nominally 0.5mm thick.
- (ii) Gyproc GFS1 fixing strap manufactured from galvanised mild steel nominally 0.5mm thick

All metal components supplied by British Gypsum Limited.

### Fasteners

- i) 25mm Gyproc drywall screws supplied by British Gypsum Limited
- ii) 42mm Gyproc drywall screws supplied by British Gypsum Limited.
- iii) 60mm Hilti Hus fixings supplied by Hilti Limited

## TEST PROCEDURE

The test was conducted fully in accordance with BS EN 1364-1:1999. The specimen was subjected to fire from one side, as specified in BS EN 1364-1:1999. As the test specimen is considered to be symmetrical one test is adequate to cover the fire resistance performance in both directions.

The test procedure used was EN 1364-1 Issue 1.

The ambient temperature at the commencement of the test was 22°C.

Customer: **British Gypsum Limited**

BTC 11172F: Page 5 of 31

No. 0296

The furnace pressure was maintained at  $18 \pm 2$  Pa positive with respect to atmosphere, at a point 100 mm below the top of the specimen, except during the first 6 minutes of the test.

The test conditions did not meet the full requirements of BS EN 1363-1:1999 as the furnace linings and test frame stiffness did not fully comply. The test centre is of the opinion that these deviations from the documented method will not unduly effect the result of the test.

### TEST RESULTS

The requirements of the standard were satisfied for the following periods:

<b>Integrity</b>	<b>102 minutes (sustained flaming)</b>
<b>Insulation</b>	<b>93 minutes (unexposed face thermocouple)</b>

The test was terminated at 102 minutes.

### LIMITATIONS

The results only relate to the behaviour of the element of construction under the particular conditions of test; they are not intended to be the sole criteria for assessing the potential fire performance of the element in use nor do they reflect the actual behaviour in fires.

The specification and interpretation of fire test methods are the subject of ongoing development and refinement. Changes in associated legislation may also occur. For these reasons it is recommended that the relevance of test reports over 5 years old should be considered by the user. The laboratory that issued the report will be able to offer, on behalf of the legal owner, a review of the procedures adopted for a particular test to ensure that they are consistent with current practices, and if required may endorse the test report.

## TEST DATA

### Observations

Observers: Unexposed face J McLavy  
Exposed face L Cooper

Time		<i>Observations</i>
hrs	mins	
		All observations refer to the exposed face unless otherwise stated.
	0	Test Started
	12	Jointing material started to fall.
	22	Horizontal joints opened to approximately 4-5mm. Jointing material remained over vertical joints.
	28	Horizontal joints opened to approximately 8mm. Vertical joints opened to approximately 4mm. Top left-hand corner of lower right-hand board pulled away from fixings.
	35	Right-hand vertical joint opened to approximately 15mm. Left-hand vertical joint opened to approximately 10mm. Horizontal joints opened 10-20mm.
	41	Upper half of lower centre board fell.
	43	Upper half of lower left-hand board fell. Lower right-hand board curving back at top left-hand corner.
	44	Top left-hand corner fell from lower right hand board.
	45	Vertical joints in inner layer opened to approximately 3mm.
	52	Left hand vertical joints in inner layer opened approximately 15-20mm. Right hand side of left-hand outer layer board breaking away from fixings.
1	10	Inner layer of boards 'crazed'. Inner layer lower centre boards fallen.

Customer: **British Gypsum Limited**

BTC 11172F: Page 7 of 31

No. 0296

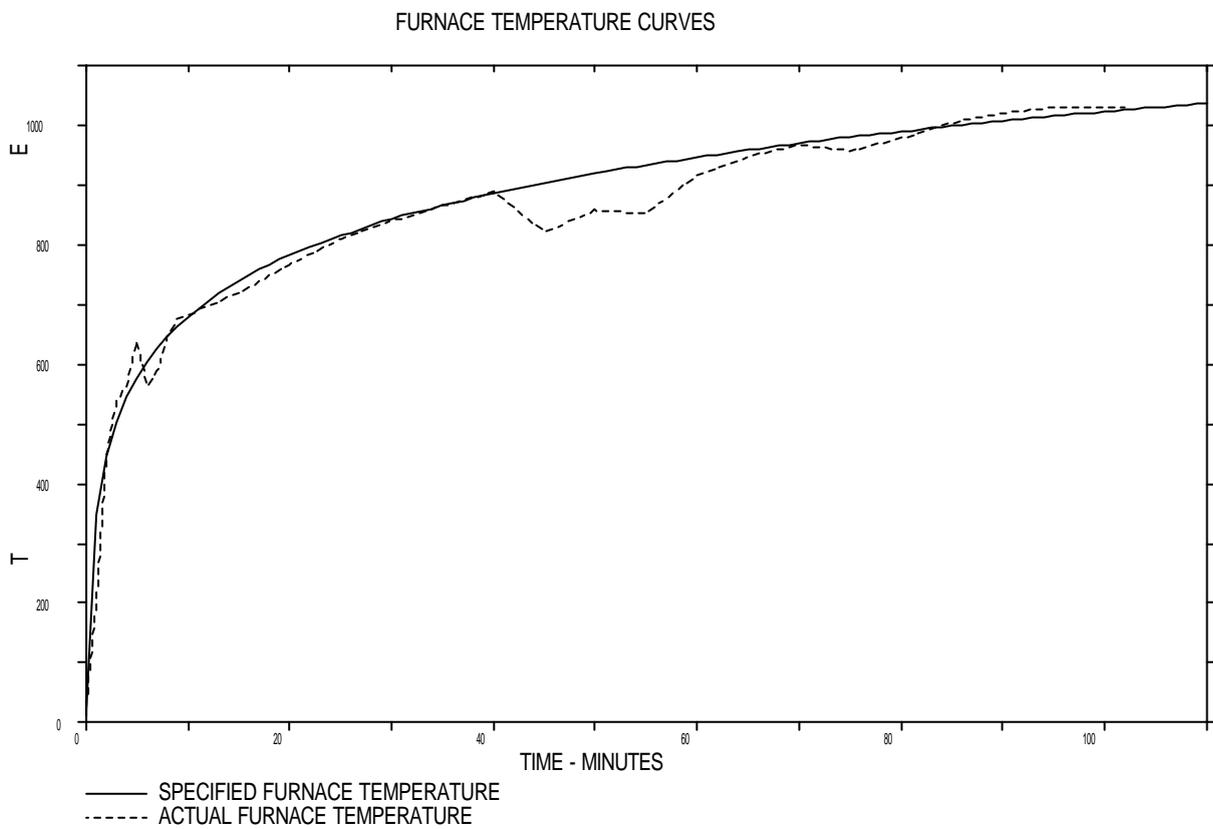

Time		Observations
hrs	mins	
		All observations refer to the exposed face unless otherwise stated.
1	16	<i>Unexposed face:</i> Screw heads began to appear at mid height on right-hand joint.
1	19	<i>Unexposed face:</i> Heavy smoke emitted from top half of fixed edge.
1	20	<i>Unexposed face:</i> Screw heads appearing on left-hand joint and within the field of the boards.
1	24	All exposed face boards fallen. Inner layer of unexposed face boards 'crazed'.
1	28	<i>Unexposed face:</i> Discolouration of jointing material around screw heads.
1	31	<i>Unexposed face:</i> Discolouration of plasterboard face adjacent to screw positions.
1	33	<i>Unexposed face:</i> <b>INSULATION FAILURE:</b> Temperature of 280°C measured just below thermocouple no.35 position.
1	34	<i>Unexposed face:</i> Crack developing at point of insulation failure. Gap open approximately 1mm. Cotton pad used – not glow or flaming.
1	36	<i>Unexposed face:</i> Discolouration of board at inner layer horizontal joint at centre of specimen.
1	37	<i>Unexposed face:</i> Discolouration of outer board over right-hand vertical joint.
1	38	<i>Unexposed face:</i> Paper charring at height of approximately 600mm (over inner layer horizontal joint).

Time		Observations
hrs	mins	
		All observations refer to the exposed face unless otherwise stated.
1	39	<i>Unexposed face:</i> Cotton pad used 300mm below thermocouple no. 35. No glow or flaming.
1	40	<i>Unexposed face:</i> Paper charring adjacent to free edge.
1	41	<i>Unexposed face:</i> Deflection transducers removed.
1	42	<b>INTEGRITY FAILURE:</b> Sustained flaming at centre of specimen between thermocouples 35 and 22. <b>TEST TERMINATED</b>

- Missing data due to thermocouple fault.

Specimen Lateral Deflection

A negative deflection indicates movement toward the furnace.

Negative readings indicate deflection into the furnace.  
Transducers removed at 101 minutes.

**PHOTOGRAPHS**

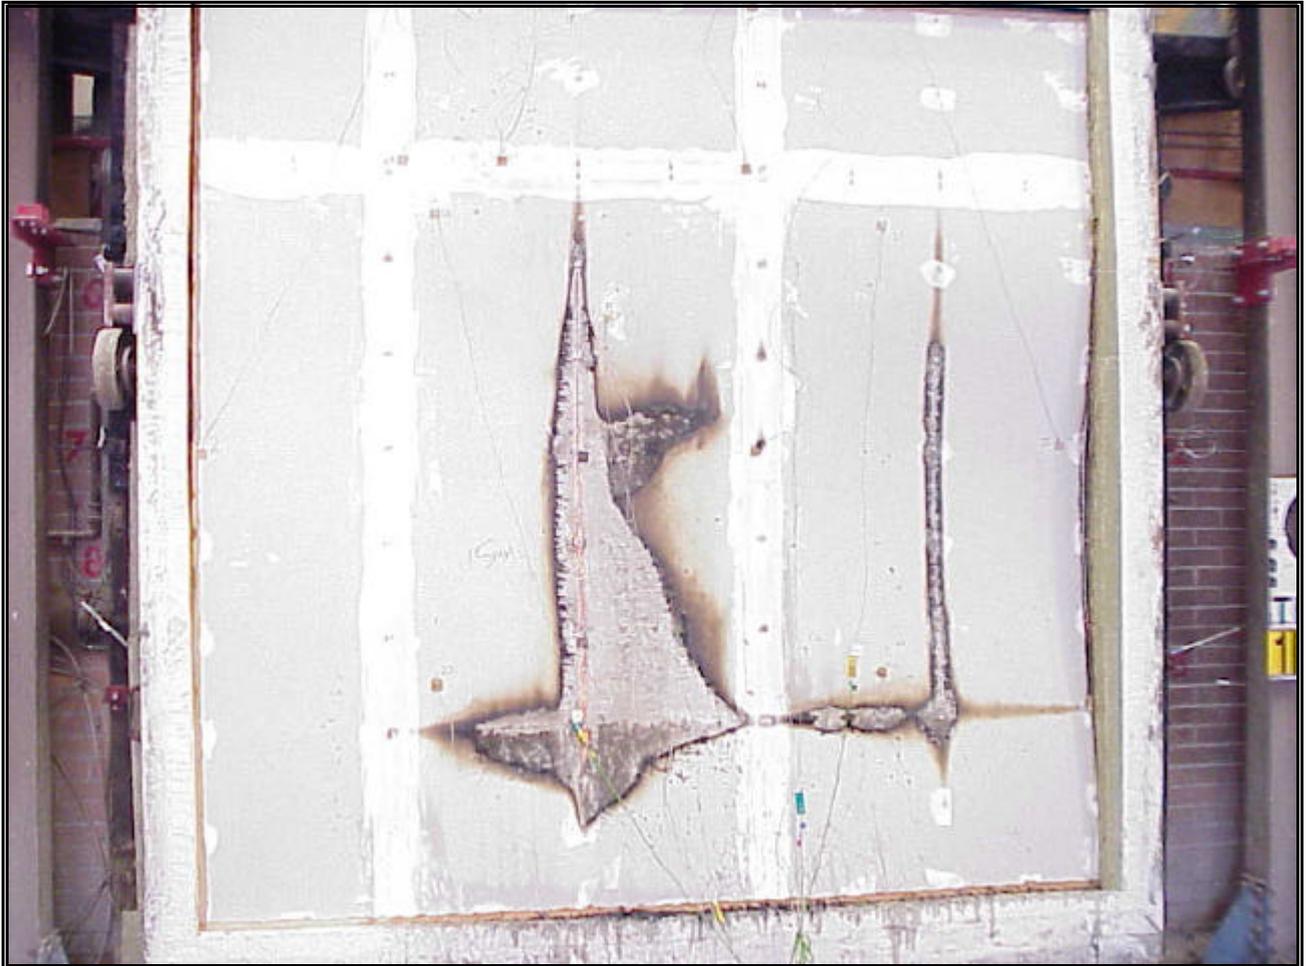

**Photo 1.** Exposed face prior to test.

**Photo 2.** Unexposed face prior to test

**Photo 3.** Unexposed face of specimen at 60 minutes.

**Photo 4.** Specimen following test termination (sustained flaming of paper liner visible)
