FIELD OF DIRECT APPLICATION

49

FOREWORD

This test report details a fire resistance test conducted on a sheet and stud partition system. The test sponsor was British Gypsum Limited.

The test specimen was installed by British Gypsum Limited. The construction of the specimen took place between the 2nd and 3rd June 2003. British Gypsum Limited designed the partition system and selected the materials for the test specimen.

The test was carried out on the 10th June 2003.

This report details the method of construction, the test conditions and the results obtained when the specific element of construction described herein was tested following the procedures outlined in EN 1363-1, and where appropriate EN 1363-2. Any significant deviation with respect to size, construction details, loads, stresses, edge or end conditions other than those allowed under the field of direct application in EN 1364-1 is not covered by this report.

Because of the nature of fire resistance testing and the consequent difficulty in quantifying the uncertainty of measurement of fire resistance, it is not possible to provide a stated degree of accuracy of the result.

REPORT AUTHORISATION

Report Author

James McLavy

TEST CONSTRUCTION

The specimen was constructed in a refractory concrete lined steel restraint frame having an opening of 3000mm high x 3000mm wide.

Gypframe 72C50 Standard Floor & Ceiling Channels were fixed to the head and base of the test aperture at 600mm centres with 60mm fire resistant fixings. Gypframe 70S50 'C' Studs were positioned at 600mm centres between the channels. The right hand stud viewed from unexposed face was not fixed to the perimeter test frame, and the gap between the stud and the frame lining was filled with a 25mm rock mineral fibre gasket. At the left-hand end a Gypframe 70S50 'C' Stud was used to fix the partition to the test frame with 60mm fire resistant fixings at 600mm centres.

50mm Isowool Acoustic Partition Roll (1200) was located in the cavity.

The framework was lined both sides with a double layer of 15mm Gyproc FireLine board. The inner layer was fixed around the perimeter with 25mm Gyproc drywall screws at 300mm centres. The outer layer was fixed around the perimeter and within the field of the board with 42mm Gyproc drywall screws at 300mm centres. All joints were staggered between layers.

Horizontal joints were positioned 2700mm from the base for the outer layers on both the exposed and unexposed faces of the construction. Horizontal joints were positioned 300mm from the base for the inner layers on both the exposed and unexposed faces of the construction. A Gypframe GFS1 Fixing Strap was used behind the horizontal board joints in the outer layers.

All joints were taped and filled using Gyproc Paper Joint Tape and Gyproc Joint Filler. All screw heads were spotted using Gyproc Joint Filler.

TEST MATERIALS

Gyproc FireLine

Nominally, 3000mm (long) x 1200mm (wide) x 15mm (thick), Gyproc FireLine plasterboard manufactured and supplied by British Gypsum Limited, ex East Leake works.

| | |
|-------------------------------|--------------------------|
| Actual surface density: | 11.56kg/m ² . |
| Actual thickness: | 15.06mm. |
| Board identification numbers: | 16 119 3 10:14 |
| Actual moisture content: | 0.37%. |

The surface density and thickness was calculated using the actual weight and size of a selection of the boards used in the test specimen. The moisture content of the plasterboard used in construction was established from measurements made using samples dried to a constant weight in an oven at 40°C.

Metal components

- i) Gypframe 70S50'C' Studs manufactured from galvanised mild steel using the 'Ultrasteel' process.
- ii) Gypframe 72C50 Standard Floor & Ceiling Channel manufactured from galvanised mild steel using the 'Ultrasteel' process.
- iii) Gypframe GFS1 Fixing Strap.

All metal components supplied by British Gypsum Limited.

Insulation

Nominally 50mm (thick) Isowool Acoustic Partition Roll (1200) glass mineral wool manufactured and supplied by British Gypsum – Isover.

| | |
|---------------------------|------------------------|
| Measured density: | 13.72kg/m ³ |
| Measured surface density: | 0.69kg/m ² |

The density was calculated using the insulation roll used in the test specimen.

Customer: British Gypsum Limited

BTC 12804F: Page 7 of 49

Fasteners

- i) 25mm Gyproc drywall screws supplied by British Gypsum Limited.
- ii) 42mm Gyproc drywall screws supplied by British Gypsum Limited.
- iii) 60mm fire resistant fixings.

Miscellaneous components

- i) Gyproc Paper Joint Tape.
- ii) Gyproc Joint Filler.

All miscellaneous components were supplied by British Gypsum Limited.

TEST PROCEDURE

The test was conducted fully in accordance with BS EN 1364-1:1999. The specimen was subjected to fire from one side, as specified in BS EN 1364-1:1999. As the test specimen is considered to be symmetrical one test is adequate to cover the fire resistance performance in both directions.

The test procedure used was EN 1364-1 Issue 2.

The ambient temperature at the commencement of the test was 21°C.

The furnace pressure was set to control at 18 ± 2 Pa positive with respect to atmosphere, at the top of the specimen, except during the first 5 minutes of the test.

The allowable tolerances are ± 5 Pa from 5 minutes to 10 minutes and ± 3 Pa from 10 minutes onwards. It is of the opinion of the laboratory that the variations in the furnace pressure exceeding the tolerances stated in BS EN 1363-1:1999 have not unduly influenced the results of this test. Furnace pressure data is shown on page 17.

The test conditions did not meet the full requirements of BS EN 1363-1:1999 as the test frame stiffness did not fully comply. The test centre is of the opinion that this deviation from the documented method will not unduly effect the result of the test.

TEST RESULTS

The requirements of the standard were satisfied for the following periods:

| | | |
|--------------------|--------------------------|--|
| Integrity: | Sustained flaming | 172 minutes (no failure test discontinued at the request of the customer) |
| | 25mm Gap gauge | 172 minutes |
| | 6mm Gap gauge | 169 minutes |
| | Cotton pad | 167 minutes |
| Insulation: | | 154 minutes |

The test was terminated at 172 minutes at the request of the customer.

LIMITATIONS

The specification and interpretation of fire test methods are the subject of ongoing development and refinement. Changes in associated legislation may also occur. For these reasons it is recommended that the relevance of test reports over 5 years old should be considered by the user. The laboratory that issued the report will be able to offer, on behalf of the legal owner, a review of the procedures adopted for a particular test to ensure that they are consistent with current practices, and if required may endorse the test report.

TEST DATA

Observations

Observers: Unexposed face M Fountain & A Richardson
 Exposed face P Cao

| Time | | <i>Observations</i> |
|---|------|--|
| hrs | mins | |
| All observations refer to exposed face unless otherwise stated. | | |
| | 0 | Test started. |
| | 10 | The jointing material and face paper had started to char. |
| | 20 | All joints had opened to approximately 2mm. Approximately 80% of the jointing material had fallen into the furnace. |
| | 30 | All joints had opened to approximately 7-8mm. |
| | 40 | All joints had opened to approximately 10-12mm. The lower left-hand and centre boards had started to pull away from the perimeter fixings adjacent to the horizontal joint. |
| | 50 | All joints had opened to approximately 12-14mm. |
| 1 | 00 | All joints had opened to approximately 12-15mm. |
| 1 | 10 | Horizontal joint had opened to approximately 15-20mm Left-hand joint had opened to approximately 20mm. Right-hand joint had opened to approximately 15mm. Hairline cracks had developed on the inner layer where exposed through the joints. |
| 1 | 20 | Horizontal joint had opened to approximately 25mm Left-hand joint had opened to approximately 25-30mm. Right-hand joint had opened to approximately 20mm. The lower left-hand and centre boards had detached from the perimeter fixings adjacent to the horizontal joint. |

| Time | | Observations |
|---|------|--|
| hrs | mins | |
| All observations refer to exposed face unless otherwise stated. | | |
| 1 | 30 | No visible change to the board joints. Hairline cracks had started to develop adjacent to the horizontal joint. |
| 1 | 40 | Horizontal joint had opened to approximately 30-35mm Left-hand joint had opened to approximately 30mm. Right-hand joint had opened to approximately 20-25mm. |
| 1 | 50 | Horizontal joint had opened to approximately 35-40mm Left-hand joint had opened to approximately 35mm. Right-hand joint had opened to approximately 25mm. Approximately 2-3mm wide cracks had started to develop adjacent to the horizontal joint. |
| 2 | 00 | The lower left-hand board had detached from its fixings and was peeling into the furnace along the horizontal joint. |
| 2 | 05 | Outer layer board fall – The top right-hand corner of the lower left-hand board approximately 1200mm x 600mm fell into the furnace. The lower centre board had detached from its fixings and was peeling into the furnace along the left-hand vertical joint. |
| 2 | 10 | Further outer layer board fall - A section of the lower left-hand board approximately 1000mm x 200mm (adjacent to the left-hand joint) fell into the furnace. Hairline cracks had developed on the inner layer where exposed. <i>Unexposed face</i> The jointing material had discoloured at the screw head positions on both vertical joints at 2400mm height. |
| 2 | 13 | <i>Unexposed face</i> The jointing material had discoloured at the screw head positions on the right-hand vertical joint at 1800 - 2100mm height. |

| Time | | Observations |
|---|------|---|
| hrs | mins | |
| All observations refer to exposed face unless otherwise stated. | | |
| 2 | 15 | Further outer layer board fall – Approximately 65% of the lower left-hand board had fallen into the furnace. The lower centre board had detached from its fixings and was peeling into the furnace along the horizontal joint. |
| 2 | 20 | Further outer layer board fall - A section of the lower centre board approximately 1600mm x 600mm (below the horizontal joint) fell into the furnace. The inner layer left-hand board had detached from its fixings and was peeling into the furnace along the left-hand vertical joint. |
| 2 | 22 | <i>Unexposed face</i> The jointing material had discoloured at the screw head positions on the right-hand vertical joint at 1500mm height. |
| 2 | 25 | Further outer layer board fall – The remainder of the lower centre board fell into the furnace. Inner layer board fall - A section of the upper centre board approximately 2700mm x 600mm (adjacent to the left-hand joint) fell into the furnace. |
| 2 | 28 | <i>Unexposed face</i> The jointing material had discoloured at all screw head positions on both vertical joints. |
| 2 | 30 | Inner layer board fall - A section of the upper left-hand board approximately 2000mm x 600mm fell into the furnace. The inner layer unexposed face was cracked throughout where exposed. |
| 2 | 34 | <i>Unexposed face</i> INSULATION FAILURE. The temperature rise of thermocouple No. 32 exceeded 180°C. |
| 2 | 35 | <i>Unexposed face</i> Discolouration was visible within the field of the lower centre board. |

| Time | | Observations |
|---|------|--|
| hrs | mins | |
| All observations refer to exposed face unless otherwise stated. | | |
| 2 | 36 | <i>Unexposed face</i> Discolouration was visible on the right-hand vertical joint at approximately 1500 - 2400mm height. |
| 2 | 37 | <i>Unexposed face</i> Jointing material was peeling away on the right-hand vertical joint close to thermocouple No. 21. |
| 2 | 41 | <i>Unexposed face</i> Discolouration was visible at thermocouple No. 32 (approximately 1200mm long). |
| 2 | 43 | <i>Unexposed face</i> Furnace glow was visible through cracks around thermocouple No. 21 & 32. |
| 2 | 44 | <i>Unexposed face</i> Furnace glow was visible on the left-hand vertical joint at approximately 1500mm height. |
| 2 | 45 | <i>Unexposed face</i> The cotton pad was used on the left-hand vertical joint at approximately 1500mm height but did not glow or ignite. |
| 2 | 46 | <i>Unexposed face</i> The cotton pad was used on the left-hand vertical joint at approximately 1500mm height but did not glow or ignite. |
| 2 | 47 | <i>Unexposed face</i> INTEGRITY FAILURE. The cotton pad ignited when used on the left-hand vertical joint at approximately 1500mm height. |
| 2 | 49 | <i>Unexposed face</i> FURTHER INTEGRITY FAILURE. The 6mm x 150mm gap gauge entered the furnace through the left-hand vertical joint at approximately 900mm height. |

| 147 | 61 | 47.5 |
| 148 | 61.1 | 47.1 |
| 149 | 62 | 49.4 |

| Time (mins) | Deflection at centre of the specimen (mm) | Deflection 50mm from free end of the specimen (mm) |
|----------------|---|--|
| 150 | 62.8 | 51.4 |
| 151 | 63.4 | 52.8 |
| 152 | 63.7 | 54 |
| 153 | 63.7 | 55.4 |
| 154 | 63.5 | 56.6 |
| 155 | 63.3 | 57.8 |

Both deflection measurements were taken at the mid-height of the specimen.
Negative values indicate that the specimen deflected out of the furnace.

The deflection transducers were removed after 155 minutes.

FIELD OF DIRECT APPLICATION

General

The results of the fire test are directly applicable to similar constructions where one or more of the changes listed below are made and the construction continues to comply with the appropriate design code for its stiffness and stability.

- (i) Decrease in height from 3000mm.
- (ii) Increase in the thickness of the wall (minimum thickness 130mm).
- (iii) Increase thickness of component materials (minimum Gypframe stud depth 70mm, minimum Gypframe 'C' stud gauge 0.5mm).
- (iv) Decrease in the linear dimensions of the boards but not thickness (\leq 2700mm long \times \leq 1200mm wide Gyproc FireLine).
- (v) Decrease stud spacing from 600mm.
- (vi) Decrease in fixing centres from 300mm.
- (vii) Increase in the number of horizontal joints.
- (viii) Horizontal and vertical joints, of the type tested.

Extension of Width

The width of an identical construction may be increased as the specimen was tested at nominally 3000mm wide with one vertical edge without restraint.

Extension of Height

The height of constructions tested at a minimum of 3000mm, maybe increased to 4000mm at the following fire resistance periods as the lateral deflection was below 100mm.

| 30 minutes | 60 minutes | 90 minutes | 120 minutes | 150 minutes |
|-----------------------------|-----------------------------|-----------------------------|-----------------------------|-----------------------------|
| <100mm, \therefore 4000mm |
