ENVIRONMENTAL PRODUCT DECLARATION

IN ACCORDANCE WITH EN 15804 AND ISO 14025

Gypframe metal framing components for gypsum plasterboard

The environmental impacts of this product have been assessed over its whole life cycle. Its Environmental Product Declaration has been verified by an independent third party.
MANUFACTURER:
ULTRASTEEL PRODUCTS LTD

PROGRAMME USED:
THE INTERNATIONAL EPD® SYSTEM.
For more information see www.environdec.com

PCR IDENTIFICATION:
EN 15804 as the core PCR + The International EPD® System PCR 2012:01 version 2.0 for Construction Products and CPC 54 construction services. And with reference to Institut Bauen und Umwelt e.V. PCR Guidance-Texts for Building-Related Products and Services, Part B: Requirements on the EPD for Structural steels.

PRODUCT / PRODUCT FAMILY NAME AND MANUFACTURER REPRESENTED:
Gypframe metal framing components for gypsum plasterboard.

OWNER OF THE DECLARATION:
Saint-Gobain Construction Products UK Limited trading as British Gypsum, Saint-Gobain House, Binley Business Park, Coventry CV3 2TT

EPD PREPARED BY:
Rachel Morris, LCA Analyst, British Gypsum

SCOPE:
The LCA is based on 2014/2015 financial year production data for a site in the United Kingdom for Gypframe metal framing components for gypsum plasterboard for use in Great Britain. The production site is Smethwick, West Midlands. This EPD covers information modules A1 to C4 (cradle to gate with options) as defined in EN 15804:2012.

The declared unit is 1 tonne of Gypframe metal framing components for gypsum plasterboard.

EPD of construction products may not be comparable if they do not comply with EN15804.

- CEN standard EN 15804 serves as the core PCR (Product Category Rules)
- Independent verification of the declaration, according to EN ISO 14025:2010: External
  - Internal
  - External
- Third party verifier*:
  Dr Andrew Norton, Renouables

* Optional for business-to-business communication, mandatory for business to consumer communication (see EN ISO 14025:2010, 9.4)
2.1 PRODUCT DESCRIPTION:
Gypframe metal framing components are light gauge steel profiles used in the construction of Gypsum plasterboard wall, ceiling and floor systems.

2.2 APPLICATION:
The modern, engineered alternative to traditional timber and blockwork construction, Gypframe-based wall, ceiling and floor systems are quicker and easier to install, whilst meeting the highest performance requirements. Up to 50% lighter than equivalent timber systems, and up to 70% lighter than blockwork, Gypframe metal products are easier to transport and offer a high strength to weight ratio for guaranteed performance and long life.

Gypframe components are easy to cut on site, non-flammable and won’t rot, twist or warp. They can be stored outside and installed in any weather, making it easier to schedule work.

The application of the UltraSTEEL® process uniquely identifies the British Gypsum Gypframe product range. Along with the aesthetic difference, UltraSTEEL® provides the following additional benefits over plain steel sections:
• Improved yield strength
• Improved load carrying capacity
• Improved screw retention and strip out strength
• Improved resistance to screw pull-out

2.3 TECHNICAL DATA:
Gypframe profiles are manufactured using the patented UltraSTEEL® process and conform to EN 14195:2014.

Gypframe metal framing components for gypsum plasterboard are composed of steel, carbon, manganese and phosphorous.

No additives are used, therefore there are no materials classed as substances of concern.
2.7 MANUFACTURE

Gypframe metal framing components for Gypsum plasterboard are manufactured using a cold roll form production process.

Roll forming is one of the most versatile and productive manufacturing methods ever devised for metal.

It is a continuous, high volume process involving passing flat strip in coil (01) through a series of contoured rolls, progressively forming the metal to achieve sections of virtually any profile (03). The process maintains a high degree of consistency and accuracy, producing to any desired length (04) from a wide range of materials.

One major technical breakthrough in the development of roll forming by Hadley is the UltraSTEEL® process (02) which can be applied to virtually any cold rolled formed section or product. UltraSTEEL® is an internationally patented method of altering the surface characteristics of roll formed steel in strip which, in addition to conferring an attractive finish, also provides equal strength from lighter gauge material, resulting in a more cost-effective end product.

One of the main advantages of the process is its simplicity. The UltraSTEEL® rolls can be easily added in-line (02) to an existing rolling machine. It is ideal for metal strip up to 8mm thick. The process can be applied to most metals.
2.8 ENVIRONMENT AND HEALTH DURING MANUFACTURE:

Hadley Group and Ultrasteel Products Limited strive to contribute to manufacturing in a low carbon world. From an environmental perspective, each of our products has been rigorously researched and developed to ensure it delivers optimum performance and considerable savings in raw material usage.

HEALTH

At Ultrasteel Products Limited, Health and Safety is a core value. The Company’s aim is always to be injury-free. A target of zero accidents at work for employees, visitors and contractors is set by the business.

In all aspects of the Company’s activities, the Health and Safety at Work Act and relevant Regulations and Codes of Practice are complied with. In addition there are a number of definitive Company Safety Procedures and together these determine the minimum standards expected by the Company. In order to achieve this, close co-operation with representatives of the relevant enforcement agencies is ensured.

Ultrasteel Products Limited sites are managed through ISO 14001:2004 certified Environmental Management Systems.
2.9 PRODUCT PROCESSING/INSTALLATION:
Gypframe profiles are cold roll formed from DX51D + Z140 NA-C, utilising the Hadley Industries patented UltraSTEEL® process. UltraSTEEL® is a manufacturing process that alters the characteristics of plain steel, providing higher strength capacity at a lighter gauge. The process effectively strengthens the steel by applying a surface effect through the first stage rolling process, increasing the effective thickness.

Example: base gauge = 0.5mm:
after UltraSTEEL® process = 1.0mm

Once the UltraSTEEL® process has been applied, the base material is then passed through a series of contoured rollers which progressively form the steel into the required profile. The number of rollers in the process will vary, depending on the complexity of the profile being rolled. Service entries or tabs are pierced, either at the beginning or end of this process. The formed profiles are then cut to exact length, packed and then bundled ready for delivery.
Installation of the metal profiles to form framing systems should be done according to guidelines set out within the British Gypsum literature and training guides. During the installation process, British Gypsum Wafer Head Drywall screws or Wafer Head Jack-Point screws should be used to connect two metal sections together.

Installation details can be found on the British Gypsum website at

www.british-gypsum.com/literature/site-book
www.british-gypsum.com/white-book-system-selector

2.10 PACKAGING:
Gypframe is supplied on returnable 100% recyclable wooden bearers. All wooden packaging is FSC certified.

2.11 CONDITION OF USE:
Gypframe metal components provide a system suitable for moderate impact. If the Gypframe components are correctly installed it should not require any form of maintenance.

2.12 ENVIRONMENT AND HEALTH DURING USE:
Gypframe is not classified as hazardous according to CLP.
2.13 REFERENCE SERVICE LIFE:
Gypframe is expected to last the service life of a building (60 years), as documented in The Green Guide to Specification.

2.14 EXTRAORDINARY EFFECTS:
2.14.1 FIRE
Gypframe metal framing components for gypsum plasterboards are designated A1 in accordance with Commission Decision 96/603/EC.

2.15 RE-USE PHASE:
Gypframe metal framing components for gypsum plasterboard can be recycled.

2.16 DISPOSAL:
Waste from Gypframe metal framing components is fully recyclable. The European waste catalog code is 12 01 01.

# LCA Calculation Rules

## 3.1 Functional Unit / Declared Unit
The declared unit is 1 tonne of Gypframe profile for gypsum plasterboard. The gauge of the profile varies between 0.4 - 1mm. The density of the Gypframe profile is 7750kg/m³. The Gypframe profiles Dimensional specifications datasheet can be referenced to calculate the weight of a linear metre of each type of profile. This can then be applied to calculate assumed environmental impacts for that profile from the LCA results.

## 3.2 System Boundaries
Cradle to Gate with Options: Mandatory stages = A1-3; Optional stages = A4-5, B1-7, C1-4.

## 3.3 Estimates and Assumptions
Primary data was gathered from one production site in the UK. The distance to a waste disposal site is assumed to be 32km from all waste generating sites included in the LCA. The end of life and installation waste handling is taken from the World Steel Association’s ‘Sustainable Steel At the core of a green economy’ publication. All raw materials have been calculated as a total weight of each used in the manufacture of the specific products at each site using the purchasing system. A weighted average for their transportation has been calculated for each to create an Ultrasteel figure.

All energy, water and waste are proportioned at the manufacturing site according to the kg of the specific product’s manufacture relative to the total site product manufacture between 1 April 2014 – 31 March 2015. Transport of the final material to British Gypsum manufacturing sites has been taken from Ultrasteel’s purchasing system. The transport of the final material from British Gypsum to customer has been taken from British Gypsum’s purchasing system.

## 3.4 Cut-off Rules
Data for recycled waste (waste that isn’t landfilled or incinerated) is not included in this model, only the transport to the waste recycling centre. This is due to recycled waste being considered as the start of a future products manufacture.

## 3.5 Background Data
All primary product data was provided by Ultrasteel Products Ltd and British Gypsum. All secondary data was retrieved using TEAM software using Ecoinvent 2.2 (2010) and DEAM (2006) databases.

## 3.6 Data Quality
Primary data was gathered from Ultrasteel production figures for the site in Smethwick and British Gypsum transportation figures during the 2014/2015 financial year. A 2011 fuel mix for electricity usage in the UK was assumed for all Ultrasteel Products Ltd production sites.
### 3.6 DATA QUALITY
Primary data was gathered from Ultrasteel production figures for the site in Smethwick and British Gypsum transportation figures during the 2014/2015 financial year. A 2011 fuel mix for electricity usage in the UK was assumed for all Ultrasteel Products Ltd production sites.

### 3.7 PERIOD UNDER REVIEW
The data is representative of the manufacturing processes of 2014/2015.

### 3.8 ALLOCATIONS
All production data has been calculated on a mass basis.

### 3.9 COMPARABILITY
A comparison or an evaluation of EPD data is only possible where EN 15804 has been followed and the same building context and product-specific characteristics of performance are taken into account and the same stages have been included in the system boundary. According to EN 15804, EPD of construction products may not be comparable if they do not comply with this standard. According to ISO 21930, EPDs might not be comparable if they are from different programmes.
LCA: SCENARIOS AND ADDITIONAL TECHNICAL INFORMATION

A1 RAW MATERIALS
Includes the extraction and processing of all raw materials and energy which occur upstream from the Gypframe manufacturing process.

A2 TRANSPORT TO THE MANUFACTURER
Raw materials are transported to the manufacturing site. The modelling includes road, boat and/or train transportations (average values) of each raw material.

A3 MANUFACTURING
Includes the manufacture of products and packaging. The production of packaging material is taken into account at this stage. The processing of any waste arising from this stage is also included.

A4 TRANSPORT TO THE BUILDING SITE

A5 INSTALLATION IN THE BUILDING

B1 USE OR APPLICATION OF THE INSTALLED PRODUCT

B2 MAINTENANCE

B3 REPAIR

B4 REPLACEMENT

B5 REFURBISHMENT

B6 OPERATIONAL ENERGY USE

B7 OPERATIONAL WATER USE

The product has a reference service life of 60 years. This assumes that the product will last in situ with no requirements for maintenance, repair, replacement or refurbishment throughout this period. Gypframe is a passive building product; therefore it has no impact on this stage.

C1 DECONSTRUCTION / DEMOLITION

C2 TRANSPORT TO WASTE PROCESSING

C3 WASTE PROCESSING FOR REUSE, RECOVERY AND/OR RECYCLING

C4 DISPOSAL
CONSTRUCTION PROCESS STAGE: A4-A5

A4: transport to the building site:
The table below quantifies the parameters for transporting 1 tonne Gypframe from production gate to the building site. The distance quoted is a weighted average for transport of Gypframe in Great Britain in the 2014/2015 financial year, from the production site to building sites, calculated using postcodes of our customers and quantity of product transported to each.

<table>

A5: installation in the building:
The table below quantifies the parameters for installing 1 tonne Gypframe at the building site. All installation materials and their waste processing are included. Figures quoted in the table are based on the World Steel Association’s ‘Sustainable Steel At the core of a green economy’ publication. This states that 100% of construction waste and 85% of demolition waste is recycled. The remaining 15% of demolition waste sent to landfill.

Destruction of the stratospheric ozone layer which shields the earth from ultraviolet radiation harmful to life. This destruction of ozone is caused by the breakdown of certain chlorine and/or bromine containing compounds (chlorofluorocarbons or halons), which break down when they reach the stratosphere and then catalytically destroy ozone molecules.

LCA: RESULTS - OUTPUT FLOWS AND WASTE CATEGORIES: PER TONNE GYPFRAME
RESULTS INTERPRETATION
The Product stage (A1-A3) is responsible for over 89% of Gypframe in its lifetime for the following impacts: Global warming, Non-renewable resources consumption, Energy consumption and Water consumption. Waste production is primarily attributed to the Product stage. This is due to some of the packaging materials being landfilled at this stage.

1.743MJ of the total primary energy comes from the Product stage of the life cycle. The main fuel used on Ultrasteel Products Ltd production sites is electricity. It accounts for over 65% of energy usage. Ultrasteel Products Ltd send zero waste to landfill and encourages recycling waste.

1. This indicator corresponds to the abiotic depletion potential of fossil resources
2. This indicator corresponds to the total use of primary energy
3. This indicator corresponds to the use of net fresh water
4. This indicator corresponds to the sum of hazardous, non-hazardous and radioactive waste disposed
REQUISITE EVIDENCE

Gypframe is used internally in a building. Should Gypframe be exposed to external surroundings, no corrosion should occur as galvanised steel is inherently non-corrosive.
