C05. S04. P02 – P10
GypWall curve

Including C05. S01. P02
Specialist partitions introduction
Specialist partitions

This section details specialist lightweight systems where high-security, curved, fire or blast resistant partitions are required.
Specialist partitions

This section contains our solutions that have performances above and beyond the usual project requirements. Examples are enhanced security, aesthetic appeal and explosion protection.

The systems included in this section are:

**GypWall** **curve**

Curved partition and wall lining system

All our systems are covered by SpecSure® when using genuine British Gypsum and Saint-Gobain Isover products.
GypWall curve

GypWall curve is a lightweight system specifically designed to provide curved walls and linings down to a radius of 600mm. This system provides a high degree of design flexibility and can be used to create imaginative spaces with great aesthetic impact.

Key benefits

— Cost-effective and easy-to-install solution compared to other forms of construction due to the innovative Gypframe 72 EDCL 80 Curvelyner Channel and its expandable outer flange

— Compatible with other GypWall partition systems - only the Gypframe 72 EDCL 80 Curvelyner Channel is unique to this system, minimising the number of components required on site

— No need for a curved timber template for laying out

— Can be installed as a lining to existing structures by using Gypframe ‘I’ Studs and boarding to one side only

— A smooth seamless finish is achieved through the use of our range of Thistle finish plasters

1 Concave or convex.
2 For any radius 7000mm or more, studs can be installed at 600mm centres irrespective of board type with the exception of 6mm Glasroc F Multiboard. Boards may be orientated vertically.

NB Double layer specifications can be used if required to meet specific performance criteria.

1 Studs at maximum 300mm centres. Gypframe 72 EDCL 80 should be used at head and base. Refer to table 1 for minimum bending radii and stud centres.

Important information

For maximum heights using different stud types, refer to the ‘600mm centres’ column within Partitions Introduction C04. S01. P05 – table 2. Studs should be constructed to 300 / 400mm centres as indicated by board type shown above in table 1.

Important information

When installing a curve lining with board to one side only, Gypframe ‘I’ Studs must be used. Gypframe ‘C’ Studs may only be used when board is installed to both sides.

▶ Refer to C07. S05. P02 – GypLyner iwl
GypWall curve design

Building design
GypWall curve comprises 70mm Gypframe Studs within Gypframe 72 EDCL 80 Curvelyner Channel.

Planning – key factors
The positioning of vertical board joints on exposed board layers at the apex of the curve should be avoided. The positioning of all studs, therefore, needs to be determined at the design stage. Where straight runs occur within curved partitions or linings, stud centres can be increased as determined by the specification, once 600mm off the curve.

Fixing floor and ceiling channels
Gypframe 72 EDCL 80 Curvelyner Channels must be securely fixed in two lines at 300mm centres in each line. If the floor is uneven, a 38mm thick timber sole plate equal to the width of the channel should be used.

If the concrete or screeded floor is new, consideration should be given to the installation of a damp-proof membrane between the floor surface and the channel or sole plate.

Splicing
To extend studs, overlap by 600mm (minimum). Fix together using British Gypsum Wafer Head Drywall Screws or steel pop rivets (two to each flange), or by using the Gyproc Stud Interlocking Tool twice to each flange.

Refer to Partitions introduction C04. S01. P07 – construction detail 1.

Partition to structural steelwork junctions
When designing the layout of rooms requiring separation by sound insulating walls abutting structural steelwork, consideration should be given to the potential loss of sound insulation performance through the steelwork.

Refer to C02. S01. P10 – Building acoustics.

Cavity barriers
Minimum 12.5mm Gyproc plasterboard or Glasroc F MULTIBOARD can be used to form a cavity closure within the partition to prevent the spread of fire or smoke.

Refer to C06. S07. P02 – Cavity barriers.

Moisture resistance
Glasroc H TILEBACKER can be used as a substrate for tiling, but should not be exposed to running water. Care should be taken not to over tighten screws when fixing boards and all screw heads should be fully filled with adhesive.

Fire resistance
There is no specific standard against which to test curved walls and linings, but ad hoc testing has been carried out which indicates that a slight downgrade in performance may occur compared to that claimed for the straight partition. This will depend on the system selected, e.g. board specification and radius, and in some instances a downgrade in resistance level may not occur. For specification purposes the worst case scenario is a 30 minute downgrade, e.g. for 30 minutes select a 60 minutes board specification.

Impact resistance
Glasroc F MULTIBOARD offers a high degree of impact resistance. It also has excellent mechanical properties, is not brittle and therefore is not prone to cracking or shattering when handled.

Degree of curvature
In common with other sheet materials, board-ends have a tendency to remain straight. The minimum radius, therefore, will be influenced by the board characteristics, the length of curve, the support centres, and the occurrence of board joints.

Sound insulation
Reducing the centres of the metal studs within GypWall curve can have a detrimental effect on sound insulation. Include 25mm Isover Acoustic Partition Roll (APR 1200) in the cavity for optimised acoustic performance.

Refer to C02. S01. P30 – Robustness.

Services
Penetrations
Penetrations of fire-resistant or sound-insulating constructions for services need careful consideration to ensure that the performance of the element is not downgraded. Consideration also needs to be given to the services themselves so they do not act as the mechanism of fire spread or sound transmission.

Refer to C02. S01. P32 – Service installations.

Electrical
The installation of electrical services should be carried out in accordance with BS 7671. The cut-outs in the studs can be used for routing electrical and other small services.

Refer to Partitions introduction C04. S01. P07 – construction detail 2.

Where Gypframe AcouStuds are used, services are routed through 50mm x 28mm ‘H’ shaped push-outs, at the same centres as shown in Partitions Introduction C04. S01. P07 – construction detail 2a for conventional cut-outs. Cables should be protected by conduit, or other suitable precautions taken to prevent abrasion when they pass through the metal frame.

Independent support
When designing for the installation of services such as fire dampers and associated ductwork through a GypWall partition, consideration should be given to the size and weight of the damper - this will determine whether it can be supported directly from the partition or needs to be independently supported from the structure.

**GypWall curve design (continued)**

**Fixtures**
Lightweight fixtures can be made directly to the partition linings.
▶ Refer to C02. S01. P33 – Service installations

**Board finishing**
A superior finish is easily achieved by applying Thistle skim coat plaster finish.
▶ Refer to C08. S01. P02 – Finishes

**Tiling**
Tiles up to 32kg/m² can be applied to the surface of lightweight partition systems.
▶ Refer to C08. S04. P02 – Tiling.

### Notes

1. Also available in a Moisture Resistant (MR) version. MR boards are specified in intermittent wet use areas.
GypWall curve system components (continued)

Fixing products (► Refer to C10. S04. P02 for details)

- **British Gypsum Drywall Screws**
  Corrosion resistant self-tapping steel screws for fixing board to metal framing less than 0.8mm thick ('I' studs less than 0.6mm thick).

- **British Gypsum Jack-Point Screws**
  Corrosion resistant self-tapping steel screws for fixing board to metal framing 0.8mm thick and greater ('I' studs 0.6mm thick and greater).

- **British Gypsum Collated Drywall Screws**
  Corrosion resistant self-tapping steel screws for fixing board to metal framing less than 0.8mm thick ('I' studs less than 0.6mm thick).

- **British Gypsum Wafer Head Jack-Point Screws**
  Corrosion resistant self-tapping steel screws for fixing metal to metal framing 0.8mm thick and greater ('I' studs 0.6mm thick and greater).

- **British Gypsum Wafer Head Drywall Screws**
  Corrosion resistant self-tapping steel screws for fixing metal to metal framing less than 0.8mm thick ('I' studs less than 0.6mm thick).

Plasterboard accessories (► Refer to C10. S05. P02 for details)

- **Gyproc edge and angle beads**
  Protecting and enhancing board edges and corners.

- **Gyproc Sealant**
  Used to seal air paths for optimum sound insulation.

- **Gyproc Joint Tape**
  A paper tape designed for reinforcement of flat joints or internal angles.

Finishing products (► Refer to C10. S06. P02 for details)

- **Thistle MultiFinish**
  To provide a plaster skim finish on most common backgrounds including undercoat plasters and plasterboard.

- **Thistle PureFinish**
  To provide a plaster skim finish with ACTIVair technology. Used to finish most common backgrounds including undercoat plasters and plasterboard. For more information refer to C02. S01. P49.

- **Thistle BoardFinish**
  To provide a plaster skim finish to Gyproc plasterboards.

- **Thistle Magnetic Plaster**
  To provide a plaster skim finish that provides an attraction to magnets used to finish a wide range of backgrounds, including undercoat plasters and plasterboard.

- **Thistle DuraFinish**
  To provide a plaster skim finish and provide up to 60% tougher resistance to accidental damage.
GypWall curve system components (continued)

GypWall curve installation overview

This is intended to be basic description of how the system is built.
For detailed installation guidance refer to the British Gypsum Site Book.

Gypframe 72 EDCL 80 Curvelyner Channels are suitably fixed to the floor and soffit, bent by hand to suit the required radius.

Gypframe ‘C’ Studs are suitably fixed to abutments.

The perimeter of the partition is then sealed on both sides with Gyproc Sealant.

Gypframe studs are fitted and fixed into the Gypframe 72 EDCL 80 Curvelyner Channels at the required centres. If a deflection head is required, the studs should not be fixed into the head channel and alternative temporary support may be required to stabilise the stud at the head whilst boarding proceeds.

M&E services can be located within the partition cavity.

Isover Acoustic Partition Roll (APR 1200) insulation can also be included within the partition cavity for optimised acoustic performance.

Gyproc plasterboards or Glasroc specialist boards are then fixed to the Gypframe framework with British Gypsum Drywall or Jack-Point Screws. The plasterboards are fixed horizontally, with all joints staggered. Additional studs may be required where multiple layers are specified to account for the difference that arises between inner and outer radii.

For best results Thistle plaster is applied with firm pressure, built out to the required thickness in two applications and trowelled to a smooth matt finish. Good site practice should be followed, as outlined in BS EN 13914 - 2: Design Considerations and Essential Principles for Internal Plastering.

Additional information

For full installation details, refer to the British Gypsum Site Book, available to download from british-gypsum.com.
